Rave panic button video

published on Jan 24, 2020 Photo (c) Wachiwit - Getty ImagesPersonal safety is starting to get the attention it deserves from connection-driven companies. First, there was Uber's integration of an in-app 911 text feature to increase passenger safety amid reports of sexual assault. Now the dating app Tinder joins by adding three new features to its app: a security service that connects users to personal emergency services; Photo Verification, which compares a posing photo in real time with profile photos, which can help verify the authenticity of a game and increase confidence in member profiles; and an in-app security center. Every day, millions of our members trust us to introduce them to new people, and we strive to develop innovative security features driven by world-class technology that meets the needs of today's Dature, said Eile Seidman, Tinder CEO, when announcing the new features. I am proud to share these updates, which are an important step in advancing our security work on an unmatched scale. The ProtectionsTinder uses the Noonlight platform for its app, which allows users to raise an alarm by clicking a button; Users can connect other smart devices to automatically trigger alarms for them. Until now, most Noonlight partner universities such as Washington University in St. Louis and Southern Methodist have been University. In Tinder's situation, and members of the app will also be able to share details about upcoming dates – including who, where and when they meet. It's a kind of bodyguard [and] quick backup for dates when a user meets someone for the first time, claims Brittany LeComte, co-founder and CCO of Noonlight. It's a first additional security measure to protect Tinder members, even if they've brought their interactions from the app to real life. If a Tinder user is in a dangerous situation at any time, a quick press of the Noonlight app will quietly contact Noonlight dispatchers, who in turn will send text to confirm the situation. If this text remains unanswered, Noonlight sends a code and calls it. If the user does not answer the phone at all, Noonlight will send emergency services. With the photo verification feature, users can ensure that the person they meet is the one they say they are. The feature uses artificial intelligence to give Tinder users access to a series of real-time selfies that are compared to existing profile photos of the person they meet. The feature is located according to Tinders Safety still in the incubation phase. The team says it will treat it like an ongoing update of Tinder's overall security features. Does Apple's (AAPL) experience selling the iPhone XS and XR suggest that it needs to drastically rethink its high-end iPhone prices? Probably not. However, it may suggest that Apple is sticking to its traditional formula for selling cheaper high-end phones rather than changing things as it is. Is, this year. As many readers probably know, Apple shares have fallen sharply from their highs in early October, both thanks to a tech fix and concerns about weaker-than-expected demand for their latest iPhones. iPhone concerns have been heightened by sales warnings or price cuts from numerous Apple suppliers, including Cirrus Logic (CRUS) (which gets more than two-thirds of apple's sales), Qorvo (QROV), Lumentum (LITE), Japan Display and AMS, as well as reports of iPhone production cuts. The nervousness was also heightened by the various measures Apple has taken to boost iPhone XS and (especially) XR sales. These include increasing the trade-in deals it offers to older iPhones through its GiveBack program, more aggressive promotion of these trade-in offerings in Apple's physical and online stores, and allegedly allowing iPhone XR discounts from Japanese airlines through subsidies. All of this has fueled arguments that Apple has become too greedy with its iPhone prices and is now facing the consequences. But that explanation glosses over the fact that the cheapest of Apple's three new iPhones, the 6.1-inch, LCD-based iPhone XR, which – measured by production cuts. The XR exposure of suppliers who have warned, and Apple's attempts to promote the device – seems to exceed sales expectations more than its more expensive siblings. And between the 5.8-inch iPhone XS (999 US starting price) and The XS Max (US \$1,099 USD starting price), it looks like the XS Max has sold better. Data from the analytics firm Mixpanel shows that the XS Max accounted for 2.81% of the installed iPhone base as of December 10 and the iPhone XS 2.26%. The XR (US \$749 US dollars starting price), which went on sale five weeks later than the XS and XS Max, accounted for only 1.66% of the base. In summary, the cheapest of Apple's new iPhones, a device with a starting price halfway between those who wore the iPhone 8 and 8 Plus a year earlier, seems to be the hardest to meet sales expectations. And the most expensive phones, a device with an unprecedented starting price, seem to be best in relation to expectations. Apple's biggest flaw in this iPhone upgrade cycle may not have been its prices, but its decision not to keep its last flagship iPhone (in this case, the iPhone X) around with a discount and instead launch a brand new iPhone (the iPhone XR) that has remarkable hardware compromises compared to this year's and last year's flagship phones (an LCD display instead of an OLED), only one rear camera, aluminum housing, no 3D touch support). This is the kind of strategic decision that easy with the iPhone launches next year. With the Wall Street Journal reporting that Apple has resumed production of the iPhone X, the company may not be able to wait until next September to revise the lower end of its high-end range, at least in some markets. Meanwhile, the relatively good demand for the iPhone XS Max Max that a flagship phone with premium prices can still sell reasonably well if it delivers a major hardware upgrade or two. There was clearly a pent-up demand for an iPhone X-type device with a larger display, and the XS Max addressed it. Given the significant pressure on global smartphone sales with the extension of upgrade cycles, it's still fair to wonder how much iPhone unit growth Apple will see in years if it doesn't deliver major hardware changes. But that doesn't mean the company needs to push the panic button on iPhone pricing – especially given that its profit growth strategy is increasingly centered on rising average selling prices (ASPs), service revenue, and sales of complementary hardware, rather than significantly growing iPhone volumes. Quick! The boss comes down that MLB stream! Too late, you'll get caught. Luckily for you, the boss pulled out a chair to watch the game, but you can't always count on near misses to get you through your slack-off time at work. That's why it's good to know about a great little tool available in the Chrome Web Store, called Panic Button by the VPN specialists at HideMyAss. With this handy little extension, all you do is click on the red icon and your browser tabs disappear. It doesn't matter if you only have a banned tab or prepare an entire window of them for the fantasy football season. (Yes, it's already exercise draft time, Gridiron fans.) Then, when your overseer is gone, just press the (now green) panic button and all your tabs will come back. To start with Panic Button, install it from the Chrome Web Store. Then right-click the panic icon that appears next to the address bar and select Options to customize this extension. The panic button option page. On the options page, you will first see an option to specify a keyboard shortcut that triggers the panic button if you cannot get to the mouse in time. By default, the link is F4, but you can set it to almost any key combination using CTRL, ALT, or SHIFT. After that, you have the option to protect your saved tabs password-protected to ensure additional security. Most importantly, you can specify on the options page which side or page the panic button returns to in times of crisis. By default, you'll get Chrome's new tab as your so-called secure page, but you can also make it something more specific, like B your work email. For added hard-at-work authenticity, you can add multiple secure pages. Be how many you choose, since each page means a longer loading time, and loading tabs just make you look more guilty than you already are. That's about everything there is to enjoy Panic Button, an important tool for a casual Friday. Enjoy. [about The Windows Club] Note: If you buy something after clicking on links in our articles, we may receive a small commission. Read our affiliate link policy for more details. Updated: 11/30/2020 from Computer Hope If you want to add more followers to your channel Embedding a button to subscribe to your videos can increase the likelihood that someone will subscribe to your channel. The following steps show how to add a subscribe button to all uploaded videos: Steps to add a button to subscribe to all uploaded videos You need to either create a subscription image or find a copyrighted image of a subscribe button from the Internet. Save this image as a .png or .gif, resize it to 150 x 150 pixels or less, and make sure it is 1 MB or less in size. Or, do not hesitate to use the Computer Hope Subscribe button displayed on the right. How can I resize an image? Go to studio.youtube.com. Sign in to the channel that contains the videos you want to add. On the left side of the screen, click Settings. Click Channel. Click Branding. On the pop-up screen, click Select Image. Select the subscribe screen that you saved in step 1 above. Select the Show time option. The options are end of video, custom start time, and total video. Once your Subscribe button appears in the small preview box and you select your viewing time, click Save. The Subscribe button now displays all YouTube videos from 24 hours to one week.
